

Carbon Report

SEB Nordamerikafond

Report created on: 2021-04-29

The carbon footprint provides a historic snapshot of the emissions from the equity holdings of the fund. The calculations are not comprehensive and indirect emissions, e.g. from suppliers, are based on reported data or estimates of emissions. The metric says nothing about how the portfolio contributes to a low-carbon society. For further information about the metric, see www.sebgroup.com.

Carbon Report

SEB Nordamerikafond

Report created on: 2021-04-29 | Holdings as of: 2021-03-31 | Benchmark: MSCI North America Index (Net Return)

Currency: SEK | Industry classification: GICS | Company breakdown metrics: Weighted average carbon intensity (tCO₂e / SEK 1,000 revenue)

Value: 1'359'683'348.8 SEK | Fund Management Company: SEB Investment Management AB

Executive summary

Carbon emissions shows the total amount of carbon dioxide and other greenhouse gases emitted each year by the companies included in the fund and is measured in tons of carbon dioxide equivalents (tCO₂e). Carbon emissions include scope 1 and 2. Scope 1 emissions are directly generated by the company's operations, whereas indirect Scope 2 emissions are related to the company's energy consumption.

Relative carbon footprint measures yearly carbon footprint in correlation to a certain sum invested in the fund. It enables comparisons with a benchmark between multiple portfolios, over time and regardless of portfolio size.

Carbon intensity measures yearly carbon emissions on a per revenue basis and is ultimately a measure of carbon efficiency.

Weighted average carbon intensity is a measure of the fund's exposure to carbon intensive firms.

	Total carbon emissions (tCO ₂ e)	Relative carbon footprint (kg CO ₂ e/SEK 1'000 invested)	Weighted average carbon intensity (kg CO ₂ e/SEK 1'000 revenue)	Disclosing titles by no. of companies	Disclosing titles by weight (AUM)
Portfolio	3'725.0	2.7	5.0	98.5%	97.0%
Benchmark	8'837.3	6.5	16.4	98.0%	97.6%
Portfolio vs. benchmark	42.2%	42.2%	30.5%		

Benchmark comparison

The portfolio's weighted average carbon intensity is 69.5% lower than the benchmark.

Sector comparison

The sectors Materials, Industrials and Consumer Discretionary (per GICS classification) in the portfolio make up 27.5% of the weight vs. 80.4% of the contribution to emissions.

5 smallest contributors to the emissions of the fund:

Company	Carbon emissions (tCO ₂ e)	% of total	Relative carbon footprint (kg CO ₂ e/SEK1'000 invested)	Country	Sector
Shopify	0.0	0.0%	0.0	Canada	Information Technology

Relative carbon footprint (kg CO₂e / SEK 1'000 invested)

Attribution analysis

There are two principal reasons explaining why the carbon exposure of the portfolio may differ from the benchmark: Sector allocation and Stock selection.

Sector allocation decisions will cause the carbon intensity of the portfolio to diverge from the benchmark where some sectors are more carbon intensive than others. If the portfolio is overweight in carbon intensive sectors the portfolio is likely to be more carbon intensive than the benchmark.

However, if the stocks within a carbon intensive sector are the most carbon efficient companies, it is possible that the portfolio may still have a lower carbon footprint than the benchmark. Such an impact is explained by stock selection decisions.

Explanation: The outperformance of the portfolio is based on the effect of over-/underweighting certain sectors and selecting more/less carbon intensive stocks within each sector for each of the underlying holdings. A positive number indicates that the effect increased the greenhouse gas emission (in tons of CO₂e) and a negative number indicates a decreasing effect. In this case, the sector weighting of SEB Nordamerikafond saved 3'479.5 (tCO₂e), while the stock selection saved 5'577.0 tCO₂e versus the benchmark. This explains a 39.4% outperformance through sector weighting and 63.1% carbon outperformance by stock picking.

Scope 3 analysis

The graph below compares the total emissions (including scope 1, scope 2 and scope 3) between the portfolio and benchmark.

Scope 1 emissions are direct greenhouse gas emissions from sources that are owned or controlled by the company. Includes fuel combustion on site such as gas boilers, fleet vehicles and air-conditioning leaks.

Scope 2 emissions are indirect greenhouse gas emissions from sources that are owned or controlled by the company. Includes emissions that result from the generation of electricity, heat or steam purchased by the company from a utility provider.

Scope 3 emissions are all indirect emissions (not included in scope 2) that occur in the value chain of the company, including both upstream and downstream emissions.

Portfolio company analysis

The tables below show the 10 largest greenhouse gas contributors and the 10 largest holdings, respectively, of SEB Nordamerikafond.

The carbon data section explains your carbon emissions, i.e. the amount of greenhouse gases that the portfolio finances from the company's overall emissions, relative to company ownership. You can further see what % of the overall portfolio greenhouse gas emissions each company accounts for and the section also includes weighted average carbon intensity.

In the Analysis section, the Benchmark emissions are stated and the Average sector emissions allow a comparison of the greenhouse gas intensity of a company against its respective sector, i.e. the amount of greenhouse gas emissions that an investment of the same size would have financed, would it have been invested in the overall sector rather than the specific company.

The effect on the portfolio can be found under Portfolio contribution. This is a measurement of how much a specific holding raises or reduces the carbon footprint of the portfolio. A positive number indicates that the company reduced the carbon footprint of the portfolio, whilst a negative number indicates that the company increased the carbon footprint of the portfolio.

Appendix

This table presents all holdings in the portfolio, sorted by sector, in alphabetic order.

It shows how each company contributes to the overall portfolio footprint. It allows you to see which stocks are the greatest contributors to the portfolio's emission in absolute as well as relative terms.

A positive portfolio contribution indicates that the company reduced the carbon footprint of the portfolio, whilst a negative number indicates that the company increased the carbon footprint of the portfolio. This helps with portfolio optimization and in managing the overall carbon portfolio footprint without comprising the chosen sector allocation.
